

# Population Dynamics

## *Tools for Conservation*

2019 Orchid  
Poland Workshop

Spala, Lodz  
Sept 24-27, 2019

Prof Raymond Tremblay  
University of Puerto Rico

# Objectives

- Predict with certain confidence level the possible growth or reduction in population size.

# No Problem

- collect lots of information
  - $> 10^5$  or more individuals for many, many years and from many populations

# Species we are concerned about:

- \* Few individuals
- \* Few populations

# PVA = Population Viability Analysis

- **Evaluation the risk of extinction**
  - Evaluate the risk of populations
  - Compare the risks between 2 or more populations
  - Analysis and synthesize the data
- **What is the likely impact of management?**
  - Identify the life history stages which could *impact areas* of management for modifying population growth.
  - Determine how large the conservation area and population size should be for species conservation
